SEEDING SPECIFICATIONS
Disturbed areas on which activities have ceased must be stabilized immediately.

I. Growing Season (March thru November 15)
  A. Temporary Cover – for disturbed areas which are not at finished grade and which will be redisturbed within 1 year.
    1. Site Preparation: Apply 2 ton/acre of Agricultural grade limestone, plus fertilizer 50–50–50 per acre (50 lbs of N. 50 lbs of P205 and 50 lbs of K20 per acre) and work in where possible.
    2. Seeding: 50% Annual Ryegrass 50% Winter Rye. Apply at rate of 3lb/1000 S.F.
    3. Mulch: 3 tons per acre of small grain straw.
  B. Permanent Cover – for disturbed areas at finish grade or will not be redisturbed within 1 year.
    1. Site Preparation: Re–apply toposil to area. Apply 3 tons/acre of Agricultural grade Limestone plus Fertilizer 100–200–200 (100 lbs of N. 200 lbs of P205 and 200 lbs of K20) and work in where possible.
    2. Seeding: 60% Kentucky Bluegrass
       10% Perennial Ryegrass
       30% Pennlawn Red Fescue
       Apply at rate of 4 lb/1000 S.F.
    3. Mulch: 3 tons per acre of small grain straw.

II. Non–germinating Period (Nov 15 through March 1)
  1. Apply mulch (3 tons per acre of small grain straw) to disturbed areas.
  2. Those areas that were stabilized by mulching only are to be limed, fertilized, seeded and mulched according to permanent or temporary seeding specifications at the end of the non–germinating period.

CONSTRUCTION NOTES:

1. Install silt fence where shown on the plan.
2. Install Construction Entrance at location shown. Existing adjacent paved areas and streets shall remain dirt/dust free at all times during construction.
3. Demo existing site improvements required for new construction.
4. Start foundation construct for proposed building addition. Construct Infiltration Bed for roof drainage. Place orange construction fencing around seepage bed area. Temporarily seal inlet grate with plywood and sealant while the site remains disturbed. Sediment laden runoff must be prevented from entering the stone storage area of the infiltration bed while the site remains disturbed.
5. Any topsoil stockpile generated by ITEMS 2 through 4 shall be placed in an area not subject to erosion and a silt fence barrier shall be installed and maintained around the downslope perimeter.
6. To all areas which earthmoving activities have ceased and will be subject to the action of earthmoving and other equipment, apply a mulch (wood chip – 2–3 tons per acre; hay or straw – 3 tons per acre). All other disturbed areas remaining open shall be temporarily seeded and mulched.
7. Install underground utilities following procedures set forth in UTILITIES following final grading.
8. Final grade project area and install new paving, curb and sidewalk.
9. Complete addition construction. Install rain water piping and discharge roof drains to seepage bed system. Re–spread topsoil and stabilize with seed and mulch.
10. Contractor is responsible for re–paving portions of the existing bituminous access drives and parking areas located at the property which have been damaged by construction vehicles.
11. Erosion and sediment control facilities are to be checked and properly maintained weekly and after each storm event. Sufficient quantities of silt fencing, crushed stone, straw bales, seeding and mulching should be readily available for remedial work if required.
12. Silt fencing may be removed when the site is stabilized. Accumulated sediment may be spread at the site in areas not subject to erosion.
13. Remove plywood at 2x2 inlet at Infiltration Bed once site has been permanently stabilized and uniform growth of grass has been established on all up–slope areas.
14. The Contractor is advised to become familiar with the " Erosion and Sediment Pollution Control Program Manual" by the Commonwealth of PA., Department of Environmental Resources, Latest edition.
15. Technical advice for the implementation of this program may be obtained by contacting Mr. Edward M. Magargee, Dist. Mgr., Delaware County Conservation District, at (610)892–9484.
16. Copies of these plans must be available on site throughout construction.

MAINTENANCE PROGRAM

1. Provide a silt fence barrier downslope of any topsoil stockpiles and maintain as needed. All sediment which is removed from sediment filters and berms shall be stockpiled in an area not subject to erosion and ultimately used in the final grading of the site.
2. All areas on which activities have ceased shall be temporarily seeded and mulched. Permanent grass cover shall be established by seeding and mulching following final grading.
3. Seeded areas that have washed away shall be filled and graded as necessary, reseeded and mulched.

UTILITIES

1. All new utilities to be placed underground.
2. Excavate that length of utility trench which can be installed and backfilled in one day's work.
3. Place excavated material on upslope side of trench.
4. Stabilize backfilled trench commensurate with final surface materials, I.E., seeding and mulch for lawns/wood areas, crushed stone for road areas.

TOPSOIL APPLICATION NOTES:

1. Graded areas should be scarified or otherwise loosened to a depth of 3 to 5 inches to permit bonding of the topsoil to the surface areas and to provide a roughened surface to prevent topsoil from sliding down slope.
2. Topsoil should be uniformly distributed across the disturbed area to a depth of 4 to 8 inches minimum –– 2 inches on fill outslopes. If adequate amounts of Topsoil are not available on–site then topsoil will have be obtained from an approved and permitted site. Spreading should be done in such a manner that sodding or seeding can proceed with a minimum of additional preparation or tillage. Irregularities in the surface resulting from topsoil placement should be corrected in order to prevent formation of depressions.
3. Topsoil should not be placed while the topsoil or subsoil is in a frozen or muddy condition, when the subsoil is excessively wet, or in a condition that may otherwise be detrimental to proper grading and seedbed preparation. Compacted soils should be scarified 6 to 12 inches along contour wherever possible prior to seeding.

GENERAL STRUCTURAL NOTES

GENERAL STRUCTURAL NOTES:

1. The structural drawings shall be used in conjunction with the drawings of all other disciplines and the specifications. The contractor shall verify the requirements of other trades as to sleeves, chases, hangers, inserts, anchors, holes and other items to be placed or set in the structural work.

2. The contractor shall be responsible for complying with all safety precautions and regulations during the work. The engineer will not advise on nor issue direction as to safety precautions and programs.

3. The structural drawings herein represent the finished structure. The contractor shall provide all temporary shoring, guying and bracing required to erect and hold the structure in proper alignment until all structural work and connections have been completed. The investigation, design, safety, adequacy and inspection of erection bracing, shoring, temporary supports, etc. is the sole responsibility of the contractor.

4. The engineer shall not be responsible for the methods, techniques and sequences of procedures to perform the work. The supervision of the work is the sole responsibility of the contractor.

5. Drawings indicate general and typical details of construction. Where conditions are not specifically shown, similar details of construction shall be used, subject to approval by the engineer.

6. All structural systems which are to be composed of components to be field erected shall be supervised by the supplier during manufacturing, delivery, handling, storage and erection in accordance with the supplier's instructions and requirements.

7. Contractor shall provide all temporary supports required for stability and for resistance to wind and seismic forces until the structure is capable of providing this support. Contractor to refer to A.I.S.C. steel design guide #10, "Erection bracing of low-rise structural steel frames".

8. Loading applied to the structure during the process of construction shall not exceed the safe load-carrying capacity of the structural members. The live loadings used in the design of this structure are indicated in the "Design Criteria Notes". Do not apply any construction loads until structural framing is properly connected together and until all temporary bracing is in place.

9. All ASTM and other references are per the latest editions of these standards, unless otherwise noted.

10. In accordance with Section 1704 of IBC 2018, special inspections will be required for this project. Special inspections shall be performed in accordance with the "Schedule of Special Inspections". All fabricators shall satisfy the "Exception" noted in section 1704.2.5.1, which requires the fabricator to maintain an agreement with an approved independent inspection or quality control agency. The contractor shall notify the special inspector at least 48 hours in advance for work that will require inspection or testing

11. Unless otherwise indicated, all items noted to be demolished shall become the contractor's property and be removed from the site.

12. Contractors shall visit the site prior to bid to ascertain conditions which may adversely affect the work or cost thereof.

13. Dimensions shown on the architectural drawings shall govern over dimensions shown on the structural drawings. The contractor shall generate an RFI regarding discrepancies prior to construction.

SHOP DRAWING NOTES:

1. Shop drawings and other items shall be submitted to the engineer for review prior to fabrication. The engineer's review is to be for conformance with the design concept and general compliance with the relevant contract documents. The engineer's review does not relieve the contractor of the sole responsibility to review, check and coordinate the shop drawings prior to submission. The contractor remains solely responsible for errors and omissions associated with the preparation of shop drawings as they pertain to member sizes, details, dimensions, etc.

2. Submit shop drawings as per note #3 below. In no case shall reproduction of the contract drawings be used as shop drawings. As a minimum, submit the following items for review:
   A. Concrete mix design(s).
   B. Reinforcing steel shop drawings.
   C. Pre-engineered metal building system (see notes).

Other submittals may be required per the "Schedule of Special Inspections" or the separate notes contained herein.

3. Contractor shall submit electronic shop drawings. Any additional shop drawings submitted will not be reviewed or returned.

4. Contractor shall submit a schedule indicating when each set of shop drawings will be submitted to the architect/engineer prior to any shop drawing submission.

5. All notes or questions from the detailer to the engineer or architect shall be clouded, numbered and with the text "Arch/Engr. review." Any notes or questions from the detailer to the contractor shall be clouded, numbered and with the text "C.C. Review."

6. All shop drawings shall be reviewed by the contractor before submittal to the engineer or architect. Shop drawings will be rejected if the contractor has not reviewed the shop drawings prior to submittal to engineer or architect.

7. The contractor shall produce all shop drawings. Copying, scanning and/or reusing any portion of the structural drawings as part of the shop drawings submittal is not permitted. Submittals that include reproduced portions of the structural drawings will be rejected without review.

DESIGN CRITERIA NOTES:

1. The intended design standards and/or criteria are as follows:
General: Uniform statewide bldg. code (IBC 2018, Chapter 16 as amended)

7. The lateral load resisting system of this building consists of:
Perimeter - Braced bays with steel rods
Typ. frame - Rigid frame action (with "pin-based" columns)

8. This structure has been designed with "safety factors" in accordance with generally accepted principles of structural engineering. The fundamental nature of the "safety factor" is to compensate for uncertainties in the design, fabrication and erection of structural building components. It is intended that "safety factors" be used so that the load carrying capacity of the structure does not fall below the design load and that the building will perform under design load without distress. While the use of "safety factors" implies some excess capacity beyond design load, such excess capacity cannot be adequately predicted and SHALL NOT BE RELIED UPON.

EXISTING CONSTRUCTION NOTES:

1. Before proceeding with any work within the existing facility, the contractor shall familiarize himself with existing structural and other conditions. It shall be the contractor's responsibility to provide all necessary bracing, shoring and other safeguards to maintain all parts of the existing work in a safe condition during the process of demolition and construction and to protect from damage those portions of the existing work which are to remain.

2. The contractor shall field verify the dimensions, elevations, etc. necessary for the proper construction and alignment of the new portions of the work to the existing work. The contractor shall make all measurements necessary for fabrication and erection of structural members. Any discrepancy shall be immediately brought to the attention of the engineer.

3. Welding to and within an existing facility presents potential hazards, including:
   A. Fire hazard - due to the existing construction and building contents.
   B. Structural liquefaction - due to welding across the full section of structural steel members.

Recommendations to prevent these hazards include:
   A. Fire hazard - protect existing combustibles prior to welding. Keep a separate watchman and several fire extinguishers on hand.
   B. Structural liquefaction - weld in small increments. Allow welds to harden before continuing to the next increment.
   C. Do not leave the site until satisfied that no fire hazard exists.

4. The contractor shall be responsible for the design and erection of all shoring necessary to safeguard the existing structure. Any shoring shown is a partial and schematic representation of that required. The contractor shall submit a detailed plan for shoring, bracing and protection of the existing construction.

DEMOLITION NOTES:

1. The contractor is to obtain and pay for all necessary permits for the demolition and removal work required.

2. Demolition procedures, shoring requirements, sequences, techniques, etc. either given in or implied to by these drawings are suggestions only.

3. Prior to undertaking any demolition work, the contractor shall ascertain, by survey, the existing conditions of the property and the extent of the demolition work involved.

4. The contractor shall perform all demolition work in such a manner as to protect the existing structure and be responsible to properly repair any damage which may occur as a result of his demolition work. If the contractor damaged the existing structure to remain, he shall notify the owner and engineer immediately and for all repair costs, including design and inspection expenses.

5. The contractor shall cease demolition operations and notify the owner and engineer immediately if it appears that the integrity of the structure has been affected by the demolition work.

6. The contractor shall not cut or alter any structural members to remain without written authorization by the engineer or as indicated on the structural drawings.

7. All existing dimensions (distances, elevations, member sizes, etc.) shown on the drawings shall be verified in the field by the contractor.

8. The contractor shall provide a temporary platform to catch debris from slab removal. Do not allow resulting debris to accumulate in the work area. All debris shall be disposed of in a legal manner with as little disturbance to adjacent spaces and occupants as possible.

9. Cutting of existing concrete slabs shall be performed in a neat professional manner. Drill corners and saw cut straight lines around the perimeter of the new opening.

PRE-ENGINEERED METAL BUILDING NOTES:

1. The entire pre-engineered metal building system shall be designed by the metal building manufacturer in conformance to the provisions of the "Uniform Statewide Building Code" (IBC 2018, as amended by the state) and the "Low-Rise Building Systems Manual" as published by the Metal Building Manufacturer's Association. Where these criteria conflict, the more stringent criteria shall apply.

2. It is the pre-engineered metal building manufacturer's responsibility to design the complete building system (steel framing, anchor bolts, purlins, girts, bracings, connections, roofing, wall panels, components, attachments, etc.). The manufacturer shall submit a certification letter bearing the seal of a professional engineer registered in Pennsylvania stating that the building system design meets the indicated code, performance and loading requirements.

3. The pre-engineered metal building manufacturer shall be certified by the American Institute of Steel Construction category MB. The manufacturer shall meet the "Exception" noted per IBC 2018, Section 1704.2.5.1, which specifies quality control requirements of the manufacturer pertaining to "Special Inspections".

4. The contractor shall submit shop drawings of the entire metal building system for review. The contractor shall also submit a complete structural design analysis of the building system (for record purposes only). The shop drawing submittal shall include all anchor bolt requirements and foundation reactions. All shop drawing and calculation submittals shall bear the seal of a professional engineer registered in PA. Refer to "Shop Drawing Notes" section for additional requirements.

5. Design loads to be used in connection with the metal building design are per the "Design Criteria Notes". In addition to the actual dead load, an additional collateral roof framing dead load of 5 PSF shall be included. Coordinate any equipment loads with the mechanical and architectural drawings. Pay particular attention to the code required wind loading requirements (wind exposure category, importance factor (I), etc.).

6. Calculations for frame deflections shall be done using only the bare frame method. Reductions based on engineering judgment using the assumed composite stiffness of the building envelope shall not be permitted. Drift shall follow AISC's "Serviceability Design Considerations for Low-Rise Buildings". Calculations shall be submitted verifying that the actual drift under code required loadings does not exceed the allowable.

7. The pre-engineered manufacturer shall provide all girts, purlins, and other components required for a complete system. All wall systems, such as metal studs, storefronts, etc. shall be properly supported by the metal building system. Allowable deflections of components shall be in accordance with IBC 2018.

8. The foundation design is based upon the "Butler" building system. The contractor shall be responsible for coordination of any revisions required as a result of a change in the building manufacturer, including redesign of the foundations.

9. The size, number and placement pattern of all anchor bolts shall be determined by the pre-engineered building manufacturer. Anchor bolt embedments are indicated on the drawings.

10. The pre-engineered metal building shall be designed by the manufacturer to resist lateral loads as follows:
Interior frame lines - Rigid frames (pinned-based columns)
Perimeter wall lines - Braced bays or portal frames

11. The metal building erector shall provide all temporary guying and bracing (see "General Structural Notes").

12. Unless otherwise noted or specified, all steel members shall be cleaned and painted in accordance with manufacturer's standard procedures.

13. The foundations have been designed for the reactions indicated. These are based on pinned column bases. No "fixed base" columns are permitted without the engineer's written approval.
Typ. Frame end column: 14.3k (down), 7.5k (uplift), 6.4k (horiz. DL + LL)
Typ. endwall column: 5.6k (down), 3.5k (uplift), 1.6k (horiz. DL + WL)

2. Provide concrete slabs as indicated on plans over a 15 mil polyethylene vapor barrier and 4" of porous fill as follows: 6" slab reinforced with 6x6- W2.9xW2.9 welded wire fabric and with 4000 psi mix concrete.
Maximum slump for all concrete slabs shall be 5 inches, using type I cement.

3. All welded wire fabric shall be in accordance with ASTM A-1064. Lap adjoining pieces at least one full mesh.

4. All porous fill material shall be a clean granular material with 100% passing a 1-1/2" sieve and no more than 5% passing a no. 4 sieve. Porous fill shall be compacted to 95% max. dry density per ASTM D-698.

5. Slab joints shall be filled with approved material. This should take place as late as possible, preferably 4 to 6 weeks after the slab has been cast. Prior to filling, remove all debris from the slab joints, then fill in accordance with the manufacturer's recommendations as follows:

10. In order to avoid concrete shrinkage cracking the maximum length of slab cast in any one continuous pour is recommended to be less than 100 feet. The maximum spacing of joints shall be 12'.

11. The alternate wires of the welded wire fabric must be precut at the slab contraction joint locations to create a "weakened plane". Without cutting the alternate wires, the strength of the wire will prevent the slab from cracking (separating) at the joint and the slab may begin to crack elsewhere.

12. The use of polypropylene fibers (in lieu of welded wire fabric) is prohibited without the written authorization of the engineer.

13. See the architectural drawings for exact locations of depressed slab areas and drains. Slope slab to drains where shown.

14. Slabs have been designed based on the following criteria:

15. The finish tolerance of all slabs shall be in accordance with ACI 302, Section 8.4.

16. Slabs shall be constructed in accordance with the following flatness/levelness requirements:

Slab Category	Specified	Local Minimum
Straight edged	F_F = 25 , F_L = 20	F_F = 17 , F_L = 15

Floor flatness and levelness tests shall be conducted by the owner in accordance with ASTM E 1155. GENERAL NOTES:

1. THE ELECTRICAL CONTRACTOR SHALL FAMILIARIZE HIMSELF WITH THE DRAWINGS OF ALL OTHER TRADES ON THE PROJECT. ELECTRICAL OR SYSTEMS CONNECTIONS INDICATED ON ARCHITECTURAL, MECHANICAL, CIVIL, STRUCTURAL, KITCHEN AND ALL OTHER DRAWINGS WHICH ARE PART OF THIS PROJECT, SHALL BE CONSIDERED A PART OF THIS CONTRACT AND SHALL BE PROVIDED BY THE ELECTRICAL CONTRACTOR AT NO EXTRA COST TO THE OWNER.

2. THE ELECTRICAL DRAWINGS ARE DIAGRAMMATIC IN NATURE AND AS SUCH SHALL NOT BE SCALED. REFER TO THE ARCHITECTURAL DRAWINGS FOR EXACT LOCATIONS OF DEVICES AND EQUIPMENT AND DIMENSIONAL INFORMATION PRIOR TO ROUGH-IN. COORDINATE LOCATIONS OF MECHANICAL EQUIPMENT WITH MECHANICAL CONTRACTOR PRIOR TO ROUGH-IN OF SERVICE EQUIPMENT AND WIRING.

3. COORDINATE MOUNTING HEIGHTS OF ALL DEVICES WITH ARCHITECTURAL PLANS, SECTIONS, ELEVATIONS AND CASEWORK DRAWINGS.

4. COORDINATE WALLS THAT ARE TO REMAIN AND NEW WALLS WITH ARCHITECTURAL PLANS.

5. WIRING AND CONDUIT SIZES INDICATED IN PANEL SCHEDULES ARE MINIMUM ONLY. CONTRACTOR SHALL BE RESPONSIBLE FOR DETERMINING EXACT WIRING AND CONDUIT SIZES. CONTRACTOR SHALL PROVIDE SPLICE BLOCKS AND REDUCING PINS AS REQUIRED TO TERMINATE WIRING AND MAKE FINAL CONNECTIONS.

6. ELECTRICAL BOXES IN FIRE RATED PARTITIONS SHALL NOT EXCEED 16 SQUARE INCHES IN AREA (IF 4"x4"), SHALL BE MADE OF STEEL, AND SHALL BE SUCH THAT THE CUMULATIVE AREA OF BOX "CUTOUTS" IN THE FIREWALL DOES NOT EXCEED 100 SQUARE INCHES PER 100 SQUARE FEET OF WALL AREA. ELECTRICAL BOXES ON OPPOSITE SIDES OF THE SAME FIREWALL SHALL BE SEPARATED BY A HORIZONTAL AND VERTICAL DISTANCE OF NOT LESS THAN 24 INCHES. THE ELECTRICAL CONTRACTOR SHALL MAKE MINOR ADJUSTMENTS, AS NECESSARY, TO ELECTRICAL BOX LOCATIONS TO ENSURE COMPLIANCE WITH THIS REQUIREMENT SINCE BOX LOCATIONS ARE TYPICALLY NOT DIMENSIONED ON THE DRAWINGS. CONSULT ARCHITECT IF CLARIFICATION IS REQUIRED.

7. ALL CONDUIT SHALL BE CONCEALED IN WALLS, FLOORS, ABOVE CEILING OR THROUGH MILLWORK. AT TIMES CONDUIT ROUTING IS SHOWN FOR CLARITY AND IN NO WAY PROVIDES THE CONTRACTOR ABILITY TO NOT PROVIDE CONCEALED CONDUIT AT ANY POINT OTHER POINT NOT SHOWN IN THE BUILDING. REFER TO SPECIFICATIONS FOR CONDUIT AND WIRING REQUIREMENTS BASED ON APPLICATION.

8. THE CONTRACTOR SHALL BE RESPONSIBLE FOR DETERMINING THE EXACT ROUTING OF WIRING AND CONDUITS AND SHALL BE RESPONSIBLE FOR SIZING ALL BRANCH CIRCUIT WIRING TO LIMIT VOLTAGE DROP TO 3%. CONTRACTOR SHALL SIZE CONDUIT TO ACCOMMODATE WIRING PER NEC. 20 AMPERE CIRCUITS SHALL BE SIZED AS FOLLOWS:
